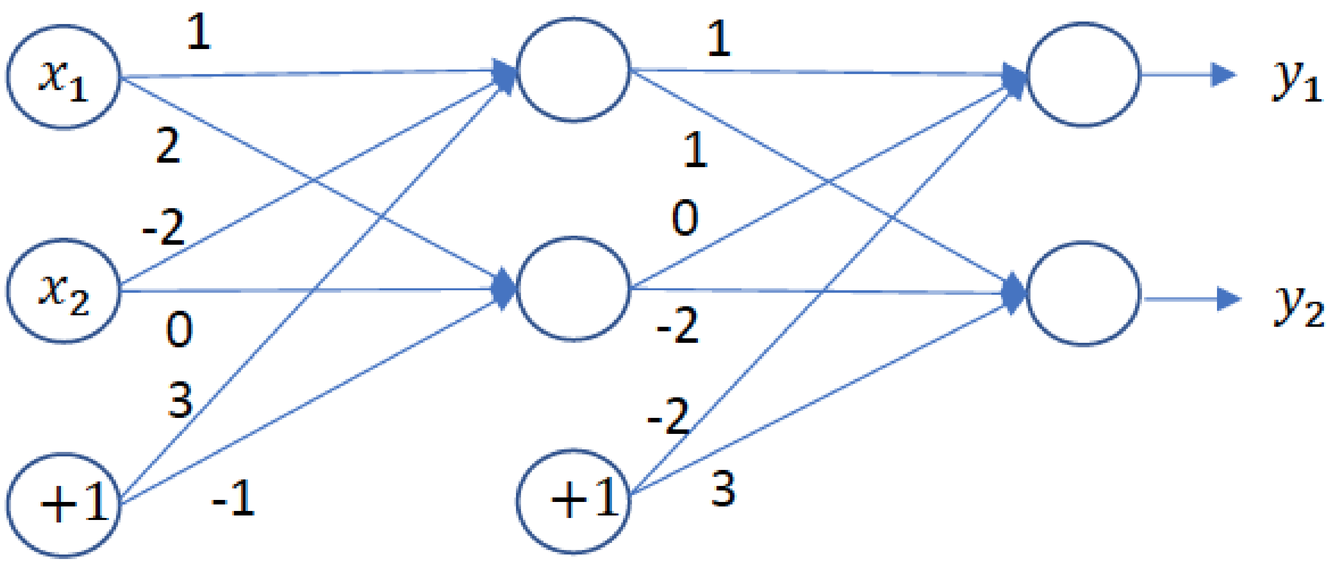
SC4001 – Tutorial 4



1. The two-layer feedforward perceptron network shown in figure 1 has weights and biases initialized as indicated and receives 2-dimensional inputs (x_1, x_2). The network is to respond with $\boldsymbol{d}_1 = \begin{pmatrix} 0 \\ 1 \end{pmatrix}$ and $\boldsymbol{d}_2 = \begin{pmatrix} 1 \\ 0 \end{pmatrix}$ for input patterns $\boldsymbol{x}_1 = \begin{pmatrix} 1.0 \\ 3.0 \end{pmatrix}$ and $\boldsymbol{x}_2 = \begin{pmatrix} -2.0 \\ -2.0 \end{pmatrix}$, respectively.

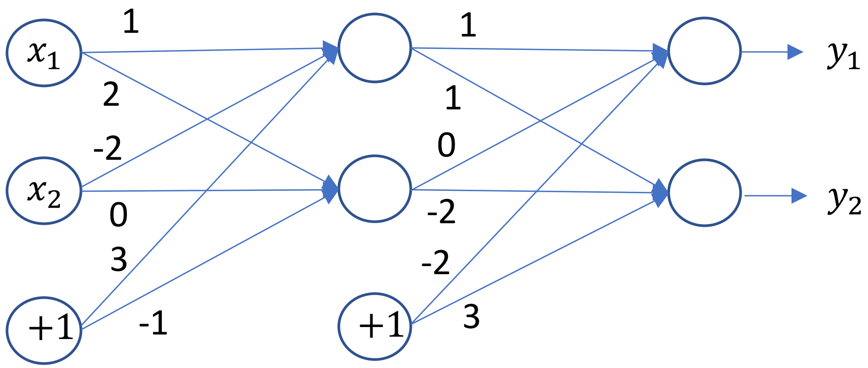
Analyse a single feedforward and feedback step for gradient decent learning of the two patterns by doing the following:

(a) Find the weight matrix $\boldsymbol{W}$ to the hidden-layer and weight matrix $\boldsymbol{V}$ to the output-layer, and the corresponding biases.
(b) Calculate the synaptic input $\boldsymbol{z}$ and output $\boldsymbol{h}$ of the hidden-layer, and the synaptic input $\boldsymbol{u}$ and output $\boldsymbol{y} = (y_1, y_2)$ of the output layer.
(c) Find the mean square error cost J between the outputs and targets.
(d) Calculate the gradients $\nabla_u J$ and $\nabla_z J$ at the output-layer and the hidden-layer, respectively.
(e) Compute the new weights and biases.
(f) Write a program to continue iterations until convergence and find the final weights and biases.

Assume a learning rate of 0.05.

Repeat above (a) – (f) for stochastic gradient decent learning.

Multilayer Perceptron (MLP):
Feedforward networks with all layers being perceptron layers.



Weight matrix to the hidden layer, $\boldsymbol{W} = \begin{pmatrix} 1.0 & 2.0 \\ -2.0 & 0.0 \end{pmatrix}$

Bias vector to the hidden-layer $\boldsymbol{b} = \begin{pmatrix} 3.0 \\ -1.0 \end{pmatrix}$

Weight matrix to the output-layer, $\boldsymbol{V} = \begin{pmatrix} 1.0 & 1.0 \\ 0.0 & -2.0 \end{pmatrix}$

Bias vector to the output-layer $\mathbf{c} = \begin{pmatrix} -2.0 \\ 3.0 \end{pmatrix}$

GD for 2-layer perceptron network:

Given a training dataset $(\boldsymbol{X}, \boldsymbol{D})$

$$\nabla_{\boldsymbol{Z}} J = (\nabla_{\boldsymbol{U}} J)\boldsymbol{V}^T \cdot g'(\boldsymbol{Z})$$

Backward propagation of gradients

3. Design a deep neural network consisting of two ReLU hidden layers to approximate the following function:

$$\phi(x, y) = 0.8x^2 - y^3 + 2.5xy$$

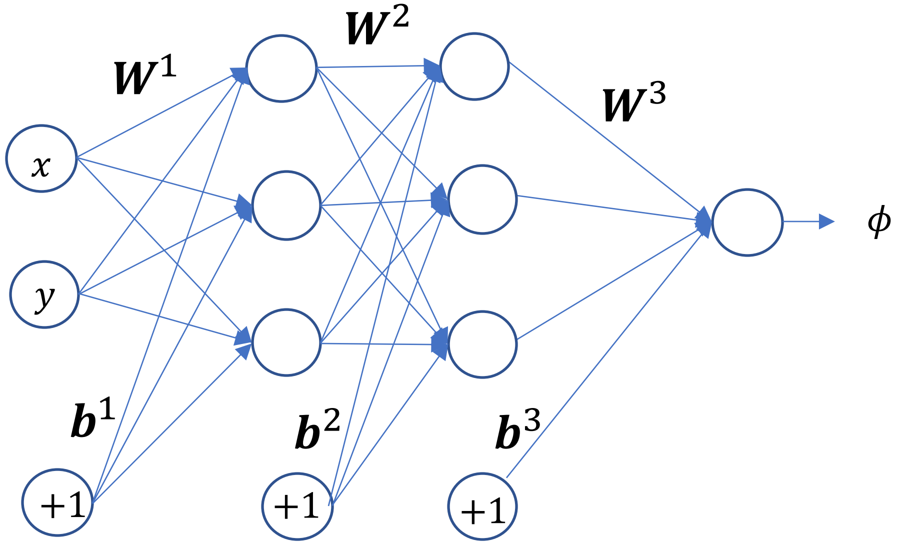
for $-1.0 \leq x, y \leq 1.0$.

Use 10 neurons and 5 neurons at first and second hidden layers, respectively, and a linear neuron at the output layer.

(a) Divide the input space equally into square regions of size 0.25×0.25 and use grid points as data points to learn the function ϕ.
(b) Train the network using gradient decent learning at learning rate $\alpha = 0.01$ and plot the learning curve (mean square error vs. iterations) and the predicted data points.
(c) Compare the behaviour of learning by plotting learning curves at rates $\alpha = 0.005, 0.001, 0.01,$ and 0.05.

$$\phi(x, y) = 0.8x^2 - x^3 + 2.5xy \quad \text{for } -1.0 \leq x, y \leq 1.0$$

Feedforward neural network with two hidden layers:

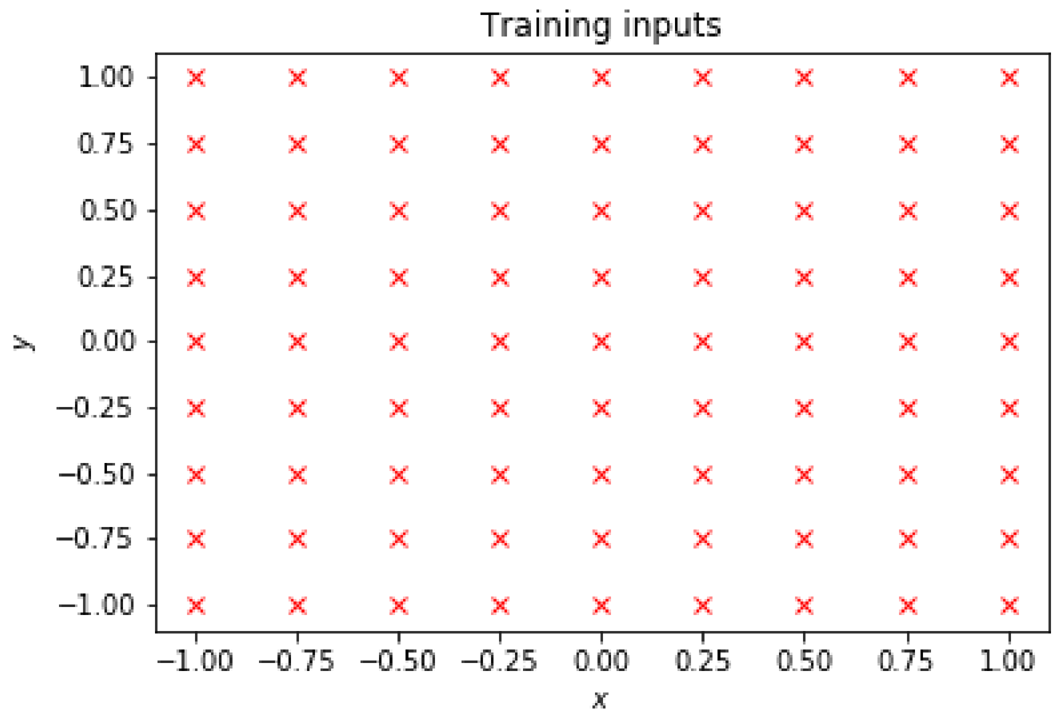


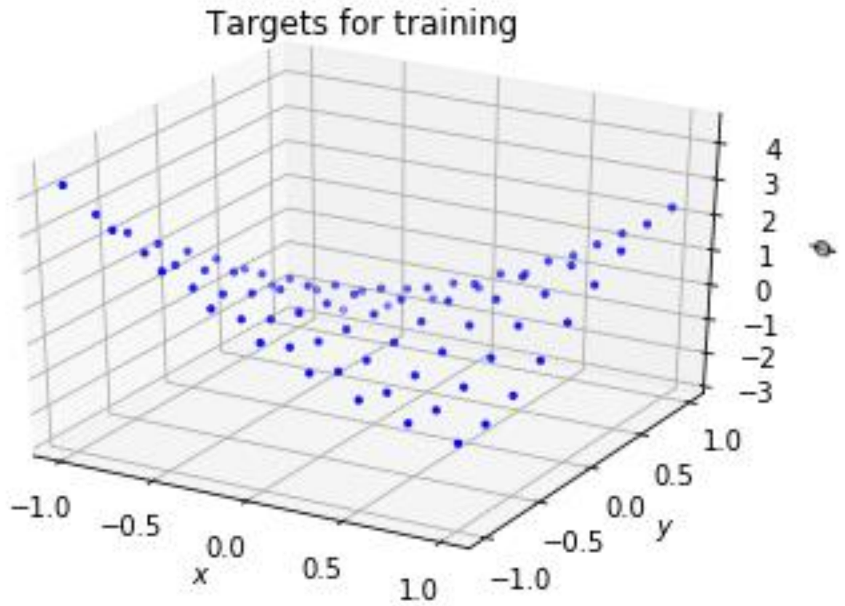
First hidden layer: **10** ReLU neurons

Second Hidden layer: **5** ReLU neurons

$$\phi(x, y) = 0.8{x_1}^2 - y^3 + 2.5xy \quad \text{for } -1.0 \leq x, y \leq 1.0$$

Data points in a grid of size 0.25x0.25:





```python
class FFN(nn.Module):
  def __init__(self):
      super().__init__()
      self.relu_stack = nn.Sequential(
          nn.Linear(2, 10),
          nn.ReLU(),
          nn.Linear(10, 5),
          nn.ReLU(),
          nn.Linear(5, 1),
      )

  def forward(self, x):
      logits = self.relu_stack(x)
      return logits
```
